

J.A.R.V.I.S.

Session 1 · Get Jarvis running on a cloud server and talking to you on Telegram

≈ 45-60 MIN | WINDOWS LAPTOP | ≈ $4 / MONTH

01
KEYS
New Claude key, spend limit, Telegram bot
10 MIN

02
SERVER
A small always-on Google Cloud machine
15 MIN

03
INSTALL
Download Jarvis and enter your settings
10 MIN

04
CONNECT
Link Telegram and send the first message
5 MIN

HAVE READY

- Windows laptop with Chrome or Edge
- Your Android phone with Telegram
- A payment card (Google verifies with it)
- Notepad open, to hold keys temporarily
- Your Claude Console login (credit already added)
- About an hour without interruptions

GOLDEN RULE

Keys and tokens only ever go into Jarvis's settings tool. Never into a chat (including with Claude), an email, or GitHub. Anything pasted into a chat should be treated as public.

PART 01

KEYS

Three things Jarvis needs to work: a fresh Claude API key, a spending cap, and a Telegram bot. All done in your browser and on your phone.

A · CLAUDE API KEY

- [ ] **1** Open **platform.claude.com** and sign in.
- [ ] **2** Go to **API Keys**. **Delete the key you pasted into the chat earlier.**
  It's in a chat transcript now, so it has to be treated as compromised.
- [ ] **3** Click **Create Key**, name it `jarvis`, and copy it into Notepad.
  It starts with `sk-ant-api`. You can only see it once.
- [ ] **4** Open **Limits** and set a **monthly spend limit**, e.g. $10.
  Jarvis runs unattended; this is your safety net.

B · TELEGRAM BOT (ON YOUR PHONE)

- [ ] **5** In Telegram, search **@BotFather** (blue check mark) and open the chat.
- [ ] **6** Send `/newbot`. Name it **Jarvis**, then pick a username ending in **bot**.
  e.g. `yourname_jarvis_bot`. It has to be unique on Telegram.
- [ ] **7** BotFather replies with a **token** like `123456789:AAF…`. Copy it into Notepad.
  Telegram Desktop on the laptop makes copying easier, but the phone works too.

YOUR NOTEPAD

CLAUDE KEY · sk-ant-api… (paste into Notepad, not here)

TELEGRAM TOKEN · 123456789:AAF…

CHECKPOINT

Notepad holds two things: a new Claude key and a Telegram token. The old key is deleted.

PART 02

SERVER

A small Google Cloud machine that stays on 24/7 so Jarvis is always reachable. The machine itself is free tier; Google charges about $3.65/month for its public address. Google's screens change now and then, so labels may differ slightly.

A · ACCOUNT AND BUDGET ALERT

- [ ] **1** Go to **console.cloud.google.com** and sign up. Add your card when asked.
  New accounts usually get free trial credit that covers the first months.

- [ ] **2** Open **Billing → Budgets & alerts → Create budget**. Set **$5** and keep the email alerts on.

B · CREATE THE MACHINE

- [ ] **3** Go to **Compute Engine → VM instances**. Click **Enable** if asked (takes a minute), then **Create instance**.

- [ ] **4** **Name:** `jarvis` · **Region:** `us-central1` (or `us-east1` / `us-west1`).
  Only these three regions are in the free tier.

- [ ] **5** **Machine type:** series E2, `e2-micro`.

- [ ] **6** **Boot disk → Change** (may be under *OS and storage*): **Ubuntu**, **Ubuntu 24.04 LTS**, disk type **Standard persistent disk**, size **30 GB**. Click **Select**.

- [ ] **7** Leave everything else as it is. Click **Create** and wait for the green check mark.

THE ONE SETTING THAT COSTS MONEY

The default disk type is **Balanced**, which is *not* free. Make sure step 6 says **Standard persistent disk** before you click Create.

CHECKPOINT

The VM list shows **jarvis** with a green check mark and an **SSH** button next to it.

PART 03

INSTALL

Click **SSH** next to your VM, then **Authorize**. In the terminal, paste each line (**Ctrl+V** or right-click → Paste), press **Enter**, and let it finish.

```
$ git clone https://github.com/cmdevsarnia/jarvis.git
$ cd jarvis
$ bash deploy/setup-server.sh            # 2–4 minutes
$ .venv/bin/python -m jarvis.configure   # answers below
$ sudo systemctl restart jarvis
```

THE SETTINGS TOOL ASKS	YOU ANSWER
Anthropic API key	Paste from Notepad. **Nothing appears** while you paste; that's normal.
Which model?	`1` for Sonnet 5.5, the lower-cost choice.
What should Jarvis call you	Your name, or "sir".
Bot token	Paste the Telegram token (also hidden).
Your chat id	Leave blank for now. Press Enter.
Set up phone calls now?	`N`. That's Session 2.

IF GIT ASKS FOR A PASSWORD

Your repository is private. Make it public (repo → Settings → Change visibility; it holds no keys) or use a GitHub personal access token as the password.

PART 04

CONNECT TELEGRAM

- [ ] **1** On your phone, message your bot **hello**. It replies **"Your chat id is ..."**
- [ ] **2** In the SSH window, run `.venv/bin/python -m jarvis.configure` again. Press Enter to keep each answer until **chat id**, then paste it.
- [ ] **3** Run `sudo systemctl restart jarvis`.

SESSION 1 COMPLETE

Text the bot *"What's the server's CPU load?"* and get a reply. Jarvis now runs 24/7; you can close the laptop.

DIAGNOSTICS

TROUBLESHOOTING

Most problems show up in the logs. In the SSH window, `journalctl -u jarvis -n 50` prints the last 50 lines.

SYMPTOM	FIX
Bot never replies	Run `systemctl status jarvis`; it should say **active (running)**. If not, read the logs. Check the bot token is correct.
Bot keeps replying with your chat id	The chat id isn't saved yet. Repeat Part 04, steps 2–3.
"My API key was rejected"	The Claude key is wrong or deleted. Create a new one and re-run the settings tool.
"I'm being rate limited"	Check your credit and spend limit at platform.claude.com.
Logs say 409 Conflict	Another copy of Jarvis is using the same bot. Only one may run per bot token.
setup-server.sh stops with an error	Screenshot the last 20 lines (keys cropped out) and send it to Claude.
Google bill higher than expected	Check the disk type is Standard and the region is one of the three free-tier regions.

EVERYDAY COMMANDS

```
$ systemctl status jarvis                    # is it running?
$ journalctl -u jarvis -n 50                 # recent logs
$ cd ~/jarvis && .venv/bin/python -m jarvis.configure   # change settings
$ sudo systemctl restart jarvis              # apply changes
$ cd ~/jarvis && git pull && sudo systemctl restart jarvis   # update
```

On Telegram, send `/reset` to clear the conversation.

WHAT IT COSTS

- Server: ≈ $3.65/month (public address)
- Claude: pay per message from your credit
- Telegram: free

UP NEXT · SESSION 2

- Phone calls: Twilio number + ngrok tunnel
- Then: the phone web app, email alerts
- Use Jarvis for a day first
