› CONNECT GOOGLE

Lets Huxley read your calendar and add or change events directly, read your Gmail and save reply **drafts**, and search your Google Docs. About 15 minutes, once, on the laptop. Free: no card needed.

PART 1 · YOUR OWN GOOGLE "APP" FOR HUXLEY

01 Go to **console.cloud.google.com** and sign in with the Google account Huxley should use.
Accept the terms if asked. Ignore any "free trial" or billing offers: none of this needs billing.

02 Make a project: click the **project picker** at the top → **New project** → name it **Huxley** → **Create**.
Then make sure "Huxley" is shown in the project picker at the top.

03 Switch on three services: ☰ menu → APIs & Services → Library. Search for each, open it, press **Enable**:
Google Calendar API · **Gmail API** · **Google Drive API**

04 Set up the sign-in screen: ☰ → Google Auth Platform (older name: *OAuth consent screen*) → **Get started**.
App name **Huxley** · support email: yours → Next · Audience: **External** → Next · contact email: yours → Next · tick agree → **Create**.

05 Stop the sign-in expiring every week: Google Auth Platform → Audience → Publish app → Confirm.
Status becomes "In production". You don't need Google's verification for your own use; you'll just see a warning when signing in (step 8).

06 Make Huxley's key: Google Auth Platform → Clients → Create client → Application type **Desktop app** → name **Huxley** → **Create**.
A box shows the **Client ID** and **Client secret**. Copy both into Notepad now (or press **Download JSON**): Google may not show the secret again.

Keep the Client secret private, like a password. Don't paste it into chats or emails; you'll paste it only into Huxley's own window in step 7.

› SIGN HUXLEY IN

PART 2 · CONNECT (2 MINUTES)

07 In the Huxley folder, double-click **connect-google.bat**. Paste the **Client ID** (Ctrl+V, Enter), then the **Client secret** (Ctrl+V, Enter: nothing shows while pasting, that's normal).

01 Your browser opens Google's sign-in. Pick your account. On **"Google hasn't verified this app"** click **Advanced → Go to Huxley (unsafe)**. That warning is about your own app, which only you use.

02 **Tick every box** (calendar, Gmail, Drive) → **Continue**. The page says **"Huxley is connected to Google"**.
The black window lists what Huxley can now do. An unticked line means you missed a box: run connect-google.bat again.

Done when the **GOOGLE** light in the top bar of Huxley's screen turns on (within a few seconds, no restart needed). Ask: ▸ What's on my calendar tomorrow?

THINGS TO TRY

CALENDAR

- ▸ Add dentist Friday at 3pm
- ▸ Move my dentist appointment to 4
- ▸ Cancel tomorrow's lunch

Huxley adds events straight away, but asks you to say yes before moving or deleting one.

EMAIL

- ▸ Anything important in my email today?
- ▸ Read me the one from the bank
- ▸ Draft a reply saying Friday works

Drafts wait in **Gmail → Drafts**. Huxley has no way to send email: you send it.

DOCUMENTS

- ▸ Find my notes about the trip
- ▸ What did I write about the budget?

Searches Google Docs, Sheets and Slides. Read-only.

SAFETY BUILT IN

Huxley treats text in emails and documents as **information, never instructions**, so a sneaky email can't make it do things.

To disconnect:
myaccount.google.com/permissions → Huxley → **Remove access**.

› TRAFFIC & VOICE

BORDER WAITS: NOTHING TO SET UP

On the next start Huxley asks which crossing you use (press Enter for **Blue Water Bridge**). Live waits in both directions appear as a **BRIDGE** line in the ATMOS panel and in your morning briefing. Ask: ▸ How's the bridge?

DRIVE TIMES WITH TRAFFIC: FREE TOMTOM KEY (OPTIONAL, 5 MINUTES)

01 Go to **developer.tomtom.com** → **Register** (free, no card) → confirm your email.

02 In the **Dashboard**, open **Keys** and copy your key (one is made for you).

03 Huxley asks for it once on its next start ("Free TomTom key…"): Ctrl+V, Enter. Also asked: your usual commute destination.
Missed it? Run `.venv\Scripts\python -m jarvis.configure` in the Huxley folder; it's under "Travel".

Ask: ▸ How long to drive to Port Huron? · ▸ How's my commute?

HUXLEY'S VOICE ON YOUR PHONE

Tap **VOX** at the bottom of Huxley's screen and pick a voice; Huxley says a test line. Your choice is remembered on that device. If every choice sounds the same (Samsung phones often do this), set the phone's own voice:

Settings → search "Text-to-speech" → Preferred engine: **Speech Services by Google** → ⚙ → Install voice data → English (United Kingdom) → try the voices and pick a male one. Then reopen Huxley.

IF SOMETHING GOES WRONG

"Access blocked: Huxley has not completed the Google verification process"	Step 5 wasn't done (the app is still in Testing). Publish it, then run connect-google.bat again.
"Error 400: redirect_uri_mismatch"	The client isn't a **Desktop app**. Make a new client (step 6) as Desktop app.
"That Google API isn't switched on"	Enable it in step 3, wait a minute, ask again.
"Google sign-in has expired"	Run connect-google.bat again (press Enter to keep the saved Client ID).
"wasn't given Gmail/Docs access"	A box wasn't ticked. Run connect-google.bat and tick every box.
